

1. Choose your own adventure game, coded in Java

```
▶ Run Stop

Welcome to the Holiday Adventure!
It's Christmas Eve, and a snowstorm has hit.
You're trying to get home before Santa arrives.

Do you take the SLEIGH or WALK through the snow?
```

This project was relatively simple, giving the choice of about 10 different endings. Using nothing but if/else statements and print commands, I was able to create a compelling text-based story using simple code. Coding this was able to get me better at using print and if/else if/ else statements. The only challenge that really needed to be solved was getting each ending to seem satisfying rather than a boring end.

2. Photography

These two photos won first and second place at the Benton County photography contest, while not necessarily a coding project, it shows my dedication to getting the absolute best version of a thing. I used my eye for photos and a camera to take these photos. I learned that you need to make your subject clear to achieve a good photo. A challenge was getting these photos before my subject moved.

3. HTML-coded games

These games are coded in a way using HTML to run out of your file folder without restrictions. Running on most computers, for computers with more restrictions, it is also coded in a way to be used in an HTML runner, allowing seamless play. This took HTML and possibly a runner. I learned more in-depth about the restrictions in place on computers. The challenges I solved were getting around the restrictions on games.
